

Wrangle Act Report

Analysis and Visualizations

I have analyzed datasets, saved images of plots and now I want to write all about my insights and observations in this report!

1. Tweets Over Time

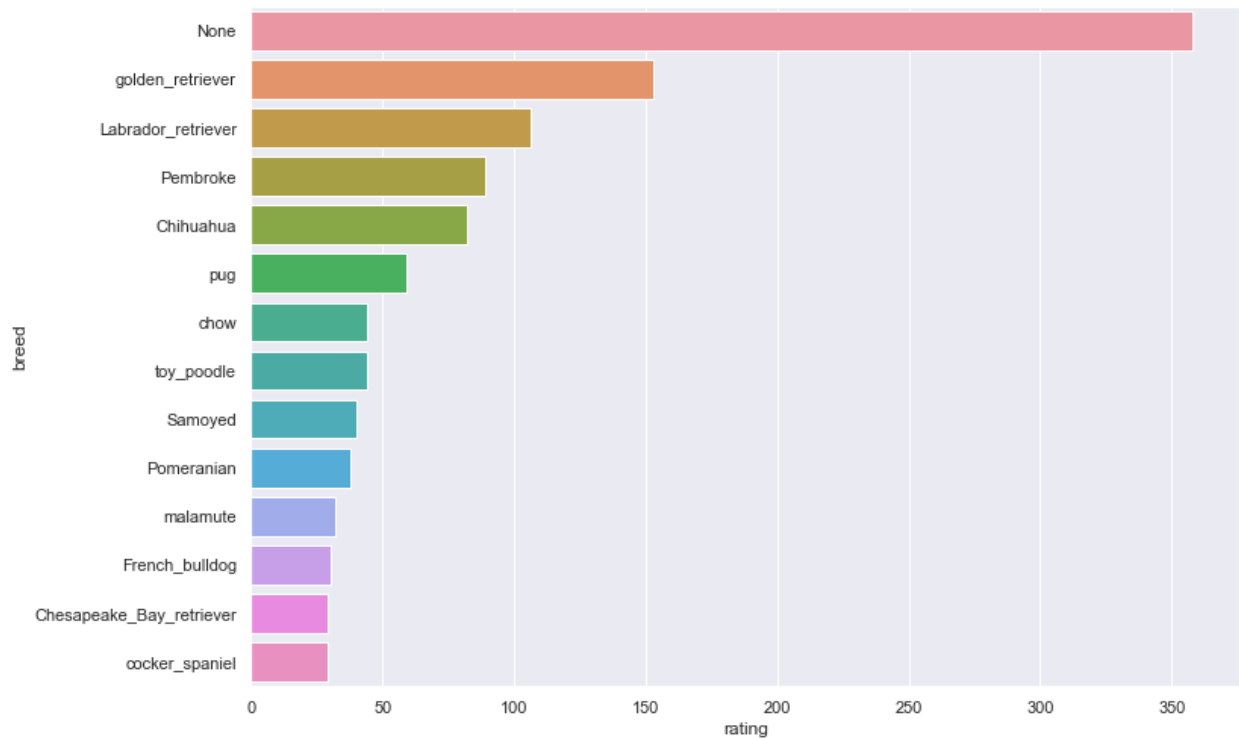

The plot describes relations between the number of tweets and periods.

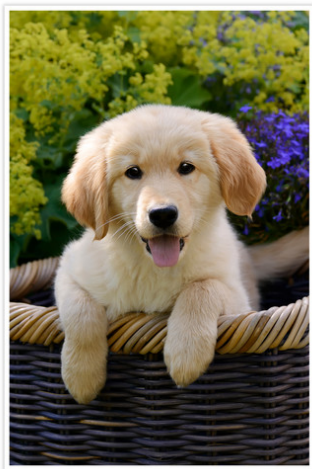

📌 Over the given period the number of tweets is significantly dropped. A maximum number of tweets are posted in approximately 2016-02 and it's 350. At the end of the period, these numbers are decreased by 85% (that is 50).

I think `WeRateDogs` should be aware of this, and implement some ways to increase users traffic on the `WeRateDogs`` page.

2. The Most Popular Dog Breeds

The bar graph describes relations between dog breed and rating.

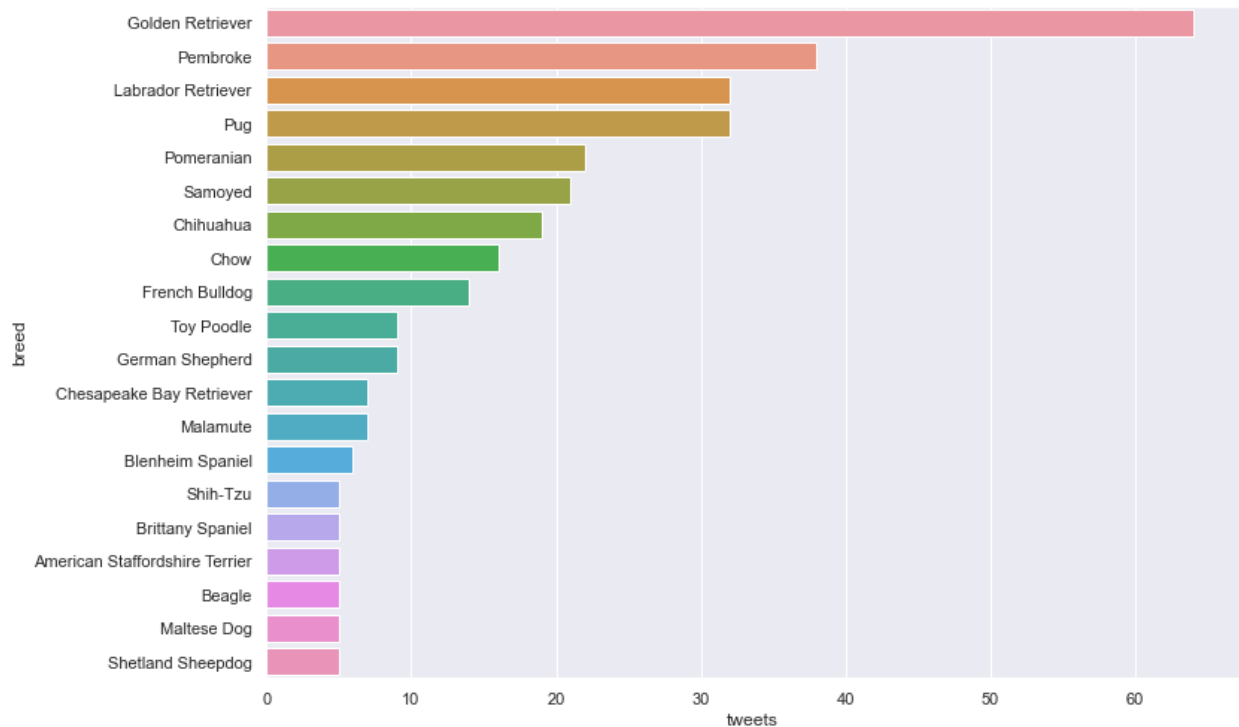

Golden Retriever

There is no doubt about ignoring **None** breeds 😊 **Golden Retriever** is absolutely the most popular dog breed on Twitter!

Labrador Retriever coming in as the second most popular breed, but other breeds are far behind.

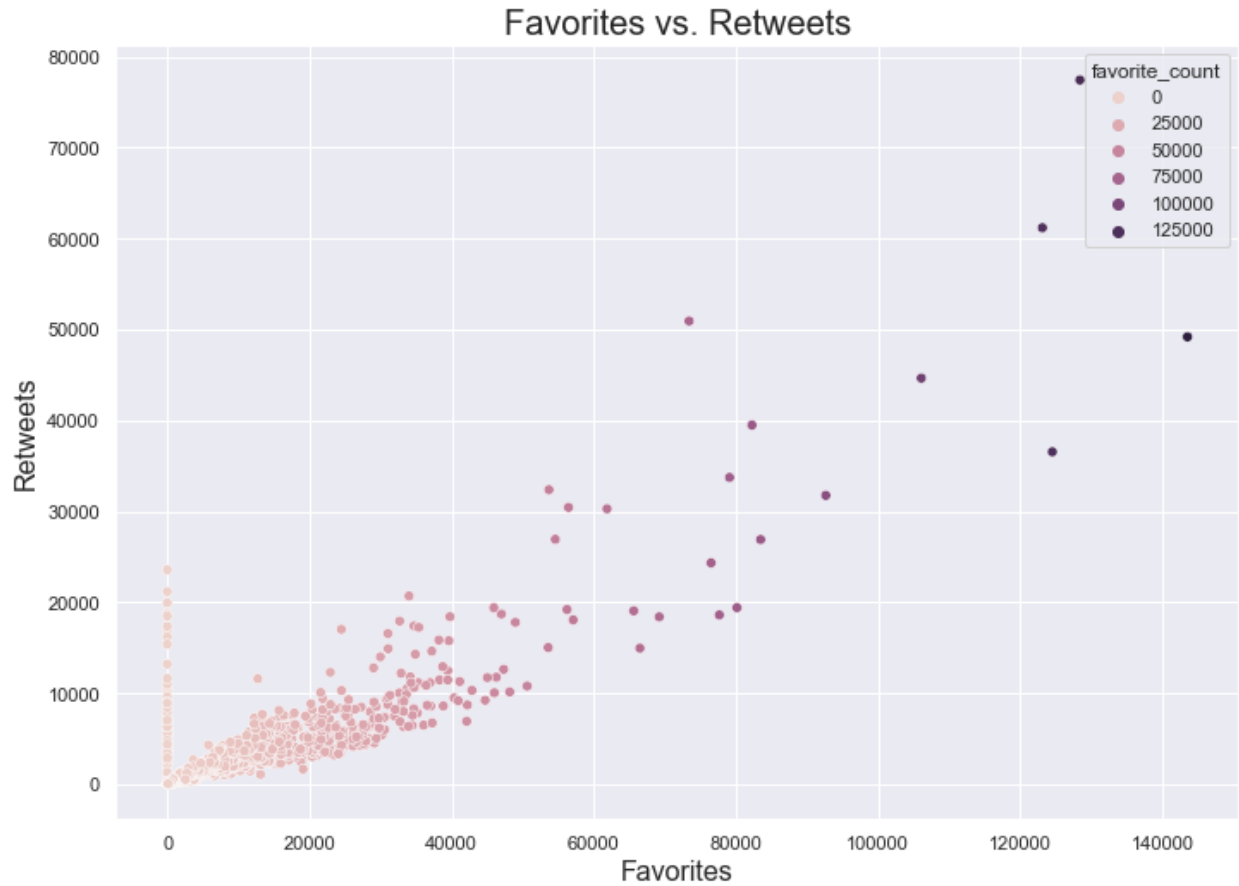

WeRateDogs should increase the popularity of other breeds by making marketing efforts or to increase their page's traffic.

3. Top 20 tweeted breeds

Golden Retriever is coming first place again! There are more than 60 tweets related to Golden Retriever, and Pembroke is coming second place. Labrador Retriever and Pug's tweets number are very same.

4. Favorites VS Retweets

Scatter plot that describes relations between likes count and retweets.

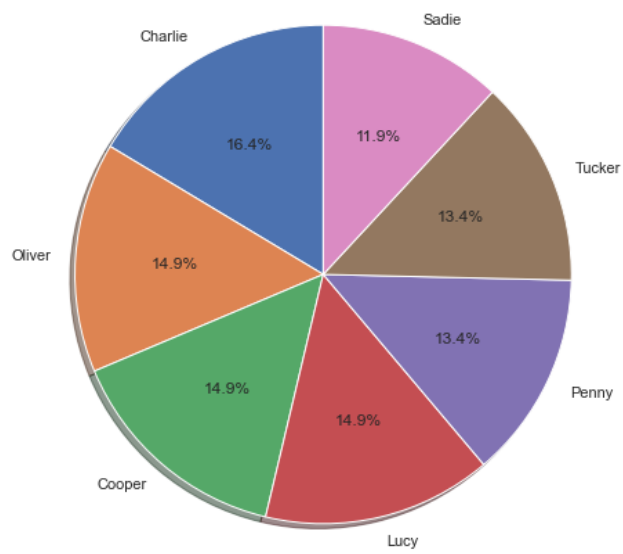

In this scatter plot we can see that there are positive correlation between tweets' likes counts (`favorites`) and its retweets. According this correlation `WeRateDogs` may understand when determining methods to increase users traffic on their page.

5. The Most Popular Dog Names

The top 4 popular dog names are:

No	Name	Count
🥇 1	Charlie	11
🥈 2	Oliver	10
🥉 3	Cooper	10
🥈 4	Lucy	10

Most Popular Dog Names

❤️ **Abduaziz Ziyodov**
